Description

Hi, we are currently investigating to use some 6s LiPo on some of our quadrotor and I wonder if you had any feedback about the Brushless controller 3.0 from mikrokopter (https://www.mikrocontroller.com/index.php?main_page=product_info&cPath=69&products_id=812) that we would need to use to do so (the 2.0 that we are currently using are only made fro LiPo 3s/4s). do you think we could flash them the same way or would it be the same problem than with the flight-ctrl version issue ?

History

As far as I know, the schematic of the BLCtrl-3.0 is not publicly available.
So the support for this version cannot be developed easily.
